

## MySQL- Part-2

### Basics about databases

#### # Creating new table

```
CREATE TABLE student(  
id INTEGER AUTO_INCREMENT,  
first_name VARCHAR(15),  
last_name VARCHAR(15),  
age INT  
);
```

```
ALTER TABLE student
```

```
ADD PRIMARY KEY(id);
```

#### # inserting values to Table 1 to perform

#### SQL joins

```
INSERT INTO student
```

```
VALUES
```

```
(01,'Yash','Gowda',33),
```

```
(02, 'Khirode', 'Kumar',29),
```

```
(03,'Kishore','Dhara',27),
```

```
(04, 'Abihesk','Kumar',34);
```

```
(05,'Nivi','Gowda',28),
```

```
(06, 'Haini', 'Gowda',31),
```

```
(07,'Pallavi','M S',29),
```

```
(08,'Suprithe','R',29),
```

```
(09,'Mohan','D P',35),
```

```
(10,'Shareef','Raja',35);
```

### Stored Procedures

```
SELECT * FROM student;
```

#### #creating stored procedure

```
CREATE DEFINER=`root` @`localhost`
```

```
PROCEDURE `get_student_info`()
```

```
BEGIN
```

```
SELECT * FROM student;
```

```
END
```

#### # calling stored info

```
CALL get_student_info()
```

#### #giving some parameters to stored

#### procedure

```
CREATE DEFINER=`root` @`localhost`
```

```
PROCEDURE `get_student_info`()
```

```
BEGIN
```

```
SELECT * FROM student
```

```
WHERE student.age<=32;
```

```
END
```

```
# calling stored info
```

```
CALL get_student_info()
```

```
--displays the records where age<=32
```

```
#giving some parameters using IN to  
stored procedure
```

```
CREATE DEFINER='root'@'localhost'
```

```
PROCEDURE `get_student_info`(IN
```

```
age INT)
```

```
BEGIN
```

```
SELECT * FROM student
```

```
WHERE student.age<=age;
```

```
END
```

```
# calling stored info
```

```
CALL get_student_info(32)
```

```
--returns the records of age <=32.
```

```
#giving some parameters using OUT  
to stored procedure
```

```
CREATE DEFINER='root'@'localhost'
```

```
PROCEDURE `get_student_info`(OUT
```

```
records INT)
```

```
BEGIN
```

```
SELECT COUNT(*) INTO records
```

```
FROM student
```

```
WHERE student.age<=33;
```

```
END
```

```
# calling stored info
```

```
CALL get_student_info(@records);
```

```
--stored in the memory
```

```
SELECT @records AS Totalrecords;
```

```
--displaying as Totalrecords the stored  
in the memory
```

```
#giving some parameters using both  
IN and OUT to stored procedure
```

```
# calling stored info
```

```
CALL get_student_info(@records,29);
```

```
--stored in the memory
```

```
SELECT @records AS Totalrecords; --  
--displaying as Totalrecords the stored
```
